Teamwork is an important part of emergency management. An effective emergency response is based on teams of people communicating and coordinating their actions. To help people to better manage teams during an emergency we have developed two team monitoring tools known as Emergency Management Breakdown Aide Memoire (EMBAM) and the Team Process Checklist (TPC). These tools have been developed in close conjunction with emergency management agencies using an iterative design cycle methodology. The tools were developed for real time performance management of teams; however, they are increasingly being used proactively to build better teams before an emergency occurs and to consider the performance of teams after an emergency in after action reviews. This talk will discuss the teamwork tools and how they can be used before, during and after an emergency to better manage teams.
